Abstract

Meyers Token is a BEP-20 asset on the Binance Smart Chain that transforms real world treasure hunting into tokenized asset ownership. The project aims to encourage this by hiding Land Drops containing Meyers Tokens all around the globe. Treasure hunters will need to combine elements of puzzle, mystery, and exercise higher level thinking and analysis to determine where a Land Drop is hidden. Our mission is to generate excitement throughout eternity by facilitating a decentralized treasure hunt that fosters investment opportunities & outdoor adventures.

Introduction

Imagine combining a treasure hunt with a geocaching adventure. Tales of Buried Treasure are as old as time. Pirates, Kings, and Outlaws have all been thought to hide valuables to protect and pass on their wealth. Chances are you've heard a treasure hunting story in your lifetime and wished that there was something out there for YOU to find. We want to give every person the opportunity to feel the excitement of searching in hopes of riches. Similar to geocaching, in which people hunt for capsules based on GPS coordinates, Meyers Token also utilizes GPS, but coupled with cryptic treasure maps utilizing NFT, NFC, and RFID technologies. Over time the deflationary nature of this token will only make each hidden land drop wallet more and more valuable. Each Land Drop wallet is (and will continue to be) loaded with between 1 to 100,000 Meyers Tokens on each.

Technical Information

Meyers Token was minted on the Binance Smart Chain on May 1st, 2021. A maximum of 21,000,000 tokens were created. The Administration Team paired Wrapped BNB with all 21M Tokens to add the initial liquidity. On June 21st, 2021, the primary contract's liquidity was locked until June 5th, 2025. Locking prevents removal of the liquidity from the pool, giving peace of mind to potential investors. The locking was accomplished in partnership with CryptEx, and can be verified publicly here:
https://cryptexlock.me/pair/56/0x6c05036efE17Db4e0ad478C21189C8e48812311f
The BSC Contract for Meyers Token is 0x5d0d52c464d7970af7f537c2963aa09fbaf6dde0 and can be explored using the [BscScan Explorer](#).

Tokenomics

With each Meyers Token transaction, there is a **3% fee** that will be paid out as follows:

- 1% is deposited into the developer's wallet. Annually, on June 5th, all tokens accumulated by this fee will be paired with BNB and added to the liquidity pool.
- 1% is split up and deposited into all Meyers Token holder wallets.
- 1% is burned. These tokens are sent to a burn address that has no private key, making them permanently irrecoverable and removed from circulation. Doing this makes the remaining tokens more valuable.

Distribution

There were originally 21,000,000 Meyers Tokens in total supply. The developer kept 1.3 million tokens in the developer wallet and will begin to liquidate those holdings at a rate of 5% annually starting June 5th, 2036. The remaining tokens are either for trade against the liquidity pool or hidden in wallets located all over the globe.

On June 5th, 2025, phase one of the treasure hunt for Land Drop wallets will begin. Using the dApp that is currently in development, Administration members & community holders will be able to mint//view their NFT Treasure Maps. At this time, the first set of clues will become available to the public. To have the best chance of finding a land drop that contains Meyers Token, one must use problem-solving skills and participate in a form of geocaching that combines elements of puzzle, mystery, and challenge in order to decipher clues pulled from the NFT Treasure Map to solve for the GPS coordinates of a Land Drop containing Meyers Token. Each Land Drop is considered a reward for the First to Find it, meaning the first person who finds the wallet can take it from the location it was hidden and assume rightful ownership of the Meyers Tokens within. The amount of tokens loaded onto each wallet will vary from 1 to 100,000. Both the Meyers Token administration team as well as the Meyers Token community will be placing these Land Drop wallets. Since Meyers Token is a Binance Smart Chain asset, one could also buy Meyers Token and help fuel the token price by swapping Smart Chain BNB for Meyers Token on any supported decentralized exchange (ex. PancakeSwap V2).

Team

The Meyers Token Administration Team is composed of:

Brian Meyers - Chief Executive Officer
Austin Egge - Chief Operations Officer
Nicky Dana - Chief Development Officer

The Marketing, Customer Service, and Operations Team members communicate via a Discord Server and is composed of dedicated and vision driven people. Prior to the public launch of Meyers Token, the top level management team will empower a fully staffed mid and lower level project management team. We will be looking for people who share our core values that have integrity, are community oriented, fun loving, and forward thinkers. Our mission is to generate excitement throughout eternity by facilitating a decentralized treasure hunt that fosters investment opportunities & outdoor adventures.

Conclusion

The prospect of finding Meyers Token will breathe life into a new version of treasure hunting and give the next generation of crypto enthusiasts something exciting to seek out. Those in search of wealth will be competing in a race to decipher and locate as many cold storage wallets as they can using clues released by the development team over time. Meyers Token exists to create a long term investment opportunity and spark excitement and wonder in a world that has begun to lose its magic charm. Together we can bring the spirit of wonder and mystery back to life by inspiring others to follow the clues, use their brains, and hopefully get rewarded for their efforts. Meyers Token is a deflationary asset; 1% of each transaction is put back into liquidity, 1% of each transaction fee is split between wallet holders, 1% of each transaction is burned. Each hidden Meyers Token wallet will increase in value the longer it sits waiting to be found. By building on and leveraging the Binance Smart Chain and the BEP-20 technical standard, less energy and resources are consumed to process transactions compared to the ERC-20 technical standard. BEP-20 was also chosen because when transacting on the Binance Smart Chain, gas prices are relatively lower and it is more affordable to move tokens between wallets. The Binance Smart Chain was designed with transaction speed, scalability, and security in mind.
